

# Common Correa *Correa reflexa*

*Flowers: May to September H 0.5-2m x W 1-2m*

Fast growing plant, mostly grown from cuttings. Suited to dry or well drained moist soils & grows in sunny open positions to shaded areas. Flowers vary from red to green. Care needs to be taken when planting due to a delicate root system, & it is often better to wait until the plant is moderately large & has developed a well formed root system before planting. The plant should be protected & kept moist with supplementary watering until established.
