

Common Tussock-grass *Poa labillardieri*

Flowers: December to February. H 30-80cm x W 30-50+cm. Seed heads to 1+m.

Fast growing attractive large tussock grass with slender grey-green or blue-green leaves. Accepting most conditions, preferring moist areas. Prefers full sun for maximum development of the flower heads. Reasonably long-lived at around 15 years & drought tolerant once established. Trimming the tussock back to 150 mm once a year in early summer stimulates growth and removes excess flammable material. Trimming & then dividing a large tussock in spring is possible. Planting in groups a metre apart will give pleasing results..
