

Grass Trigger-plant *Stylidium graminifolium*

Flowers: August to January. H 20 - 60cm x W 20 - 30cm.

Tufted, grass-like plant with long narrow leaves and attractive pink flowers on long stems. Prefers well drained soils in sunny or semi shade positions. Hardy once established. "Trigger-plant" has a unique pollinating method, each flower has a cocked flower column which is triggered by insect visitors. The trigger remains cocked until an insect probes the flower and then springs upwards and deposits pollen on the insect. Good plant for adding colour to a rockery or mixing in with grasses to make a grassy-heathland setting.
